Java Lambda Exercise v1

Type: Independent

Average Time of Completion: 2 hours

Exercise Instructions:

Practice basic Java functional programming by cloning the java lambdas TEMPLATE repository into your local training folder. The project contains a single class LambdaExercise.java that contains several empty methods. Each method covers a problem for you to implement a solution by using Java lambda expressions. Once you have completed implementing each method, run the unit tests included in TestLambdaExercise.java

Requirements:

1. Implement a solution for each method in LambdaExercise.java.
2. Check your work by running the unit tests included in TestLambdaExercise.java.

Stretch Requirements (These are optional requirements for additional practice):

1. Rewrite your solutions using different data structures or control flows that accomplish the same results as your first successful implementation.
2. Add more tests to TestLambdaExercise.java to cover more "unhappy" paths.
